## Video Notes for Free Fall

## Two Questions:

- What exactly is free fall?
- And how is free fall motion described?

## Free Fall Definition

- Moving through the air under the sole influence of gravity.
(Other forces are either non-existent or too weak to be significant.)

## Acceleration Caused By Gravity

- Gravity (when the only force) always causes an acceleration.
- The direction of the free fall acceleration is down.
- The value of the free fall acceleration is a constant value of $9.8 \mathrm{~m} / \mathrm{s} / \mathrm{s}$ (The estimated value of $10 \mathrm{~m} / \mathrm{s} / \mathrm{s}$ is often used.)
- Objects slow down as they rise; objects speed up as they fall.

## Velocity Vector

- Velocity is a vector and has a magnitude or numerical value (we call this speed) and a direction.
- Velocity is speed with a direction.
- The velocity value decreases as objects rise upward; the velocity value increases as objects fall downward.
- The direction of the velocity is always in the direction that the object moves.
- The diagram at the right is known as a velocity vector diagram. The arrows represent velocity. The length of the arrow represents the speed. The direction of the arrow reprsents the direction of the velocity vector.

## Numerical Representation - Falling from Rest

| Time | Velocity |
| :---: | :---: |
| 0 s | $0 \mathrm{~m} / \mathrm{s}$ |
| 1 s | $10 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-10 \mathrm{~m} / \mathrm{s}$ |
| 2 s | $20 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-20 \mathrm{~m} / \mathrm{s}$ |
| 3 s | $30 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-30 \mathrm{~m} / \mathrm{s}$ |
| 4 s | $40 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-40 \mathrm{~m} / \mathrm{s}$ |
| 5 s | $50 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-50 \mathrm{~m} / \mathrm{s}$ |
| 6 s | $60 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-60 \mathrm{~m} / \mathrm{s}$ |

## Numerical Representation - Thrown Upward From Ground

| Time | Velocity |
| :---: | :---: |
| 0 s | $60 \mathrm{~m} / \mathrm{s}, \uparrow$ or $+60 \mathrm{~m} / \mathrm{s}$ |
| 1 s | $50 \mathrm{~m} / \mathrm{s}, \uparrow$ or $+50 \mathrm{~m} / \mathrm{s}$ |
| 2 s | $40 \mathrm{~m} / \mathrm{s}, \uparrow$ or $+40 \mathrm{~m} / \mathrm{s}$ |
| 3 s | $30 \mathrm{~m} / \mathrm{s}, \uparrow$ or $+30 \mathrm{~m} / \mathrm{s}$ |
| 4 s | $20 \mathrm{~m} / \mathrm{s}, \uparrow$ or $+20 \mathrm{~m} / \mathrm{s}$ |
| 5 s | $10 \mathrm{~m} / \mathrm{s}, \uparrow$ or $+10 \mathrm{~m} / \mathrm{s}$ |
| 6 s | $0 \mathrm{~m} / \mathrm{s} \longleftarrow$ Peak |
| 7 s | $10 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-10 \mathrm{~m} / \mathrm{s}$ |
| 8 s | $20 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-20 \mathrm{~m} / \mathrm{s}$ |
| 9 s | $30 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-30 \mathrm{~m} / \mathrm{s}$ |
| 10 s | $40 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-40 \mathrm{~m} / \mathrm{s}$ |
| 11 s | $50 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-50 \mathrm{~m} / \mathrm{s}$ |
| 12 s | $60 \mathrm{~m} / \mathrm{s}, \downarrow$ or $-60 \mathrm{~m} / \mathrm{s}$ |

Numerical Patterns:

- When rising, velocity values decrease by $10 \mathrm{~m} / \mathrm{s}$ for every 1 s of time $\Delta$.
- When falling, velocity values increase by $10 \mathrm{~m} / \mathrm{s}$ for every 1 s of time $\Delta$.
- The velocity at the highest position is $0 \mathrm{~m} / \mathrm{s}$.
- For a launch velocity of $60 \mathrm{~m} / \mathrm{s}$, it takes 6 s to slow down to $0 \mathrm{~m} / \mathrm{s}$.
- For a launch velocity of $60 \mathrm{~m} / \mathrm{s}$, it takes 6 s to rise to the peak, 6 s to fall from the peak, and the total time in the air is 12 seconds.
- There are two locations where the speed is $20 \mathrm{~m} / \mathrm{s}$. One is 2 seconds before the peak and one is 2 seconds after the peak.
- Whenever objects are at the same height they have the same speed.
